Skills

Languages: C#, JavaScript, TypeScript

Frontend: React, Unity UI Toolkit (UXML/USS), HTML5, CSS3, Figma

Backend & Data: REST APIs, PlayFab Economy V2, Firebase, Supabase, MongoDB, JSON, Postman

AI & Tooling: AI-assisted development (Claude Code), LLM API integration, Google Apps Script, Git, GitHub

Experience

Software Development Engineer I, Petals Studio

May 2023 – Present

- Built and shipped player-facing meta-game systems (shop, player progression, rewards, and combo unlocks) for **Melee Madness**, a live multiplayer mobile game, using Unity UI Toolkit (UXML/USS) and a library of reusable custom controls.
- Owned the in-game economy integration on **PlayFab Economy V2**: modeled the combo and weapon catalog with bidirectional linking, and built bulk catalog-import tooling to publish items programmatically.
- Built dynamic shop and combo screens that render unlocked vs. locked content from live catalog and inventory state, so the UI stays in sync with backend economy data.
- Built the React.js frontend for **Qzone** (qzone.live), a quiz product: state management, REST API integration, and dynamic question rendering.

Software Development Engineer Intern, Caravel.Tech

Jun 2022 – Oct 2022

- Sole programmer on a hyper-casual Tag game: built a fully working prototype in Unity and C# over the four-month internship, roughly 2,000 lines of C# code.
- Cut the game's build size by 25% through asset and code optimization.

Projects

Roundtrip (roundtrip.one)

2026

- Built and launched a React PWA for planning group trips: a shared day-by-day itinerary with maps and weather, packing lists, outfits, budget tracking, and bookings.
- Trip-mates join with a short code and edit the same trip with live sync; the app works offline and installs to the home screen. Used it daily on a 24-day trip abroad.
- Adding an AI layer for LLM-generated itineraries and chat-based plan editing.
- *Tools:* React, TypeScript, Supabase, LLM APIs

Gamification Level Automation

2023

- Built a Google Apps Script pipeline that turns spreadsheet inputs into validated JSON level configs and pushes them over a REST API, so non-technical admins can create and update game levels without engineering help.
- Added a custom in-sheet UI (menus, dialogs) and environment detection so admins publish safely to the right environment.
- *Tools:* Google Apps Script, REST APIs, JSON

Education

Manipal University Jaipur, Bachelor of Technology in Computer Science

July 2020 – July 2024

- CGPA: 8.2
